

By default first git branch in local will be master when we do git init.

In the diagram "wc" means working copy.

## Git pull-

It will pull the latest code from remote master to local repo and working copy.

## Git fetch-

This will pull the code from remote master to the local repo, but working copy will not get the latest code. To see the code from fetch in your working copy we use the git merge command.

Git pull – git fetch + git merge.
